1. Purpose of this document

This is a technical document describing the contents of the Climate Research Data Package (CRDPv2) of the Glaciers_cci+ project. It provides an overview of the datasets created for the two study sites: Eastern Arctic and High Mountain Asia (HMA). We do not list here details of the individual datasets used for processing (e.g. date, path/row), but give a generalized overview and describe their main characteristics. The database itself is accessible on a separate webpage (http://glaciers-cci.enveo.at/crdp2_internal) containing zip files of all datasets complemented with metadata sheets (see Section 2).

2. Accessing the Climate Research Data Package

The use case input data and generated output products of Glaciers_cci are stored in the Climate Research Data Package (CRDP) database, which can be accessed via <http://glaciers-cci.enveo.at>. The website layout and look has been updated from Phase 2 of the project. The main landing page provides a brief introduction and links to a public and an internal database (Fig. 2.1). The latter is available for project partners only and is password protected.

Welcome to the **ESA Glaciers CCI Database** website. This website provides access to all products created in the ESA Glaciers CCI project. The main objective of the project is to contribute to the efforts of creating a globally complete and detailed inventory on glaciers for monitoring the impacts of climate change. The Essential Climate Variable (ECV) datasets for glaciers are sorted by category:

Glacier Area/Outlines

Elevation Change by Altimetry

Elevation Change by DEM Differencing

Ice Velocity

This work was funded by ESA within the Climate Change Initiative (CCI) Program. If you use this data for publications please cite with a formal citation. For further information please see: [ESA Glaciers CCI](#).

For any questions regarding the project or these datasets please contact:
[Dr. Frank Paul](#), Dept. of Geography, University of Zurich, Switzerland (Scientific lead)

ACCESS THE DATABASE

[INTERNAL DATABASE \(for project partners only\)](#)

Data Policy Cookies Disclaimer Impressum

Fig. 2.1: CRDP access on the website <http://glaciers-cci.enveo.at>.

Accessing public products

There is a two-step procedure for accessing the public database, related to (i) viewing and selecting of products and (ii) downloading the products. The first step “Viewing and selecting” does not require any registration. In the second step “Downloading of the product” we ask for the approval of a data usage disclaimer by providing name, affiliation and email address, a password is not required (see Figure 2.2). The entered information is only used for tracking the use of the products, fully compliant with EU data policy standards. Entering the Glaciers_cci CRDP public database provides direct access to released products, which can be selected and downloaded. All datasets are provided in a table providing some basic description

and the spatial and temporal coverage, type of data and downloadable metadata. The basic layout of these tables are the same as in the internal database and are further described in the next section. Eventually, the products from Glaciers_cci+ will be added here, currently these only include products from Phase 1 and Phase 2. For more details on these products, we refer to the CRDP document of Phase 2 of the project [RD1].

The screenshot shows the 'Glaciers CCI Database' website. At the top left is the ENVEO logo, and at the top right is the ESA logo. Below the ENVEO logo, it says 'Glaciers CCI Database' and 'Operated by ENVEO'. A 'Disclaimer' section follows, with sub-sections for 'DATA USE AND COPYRIGHT', 'WHY CITE ESA GLACIERS CCI DATA SETS?', and 'HOW TO CITE ESA GLACIERS CCI DATA'. Below this is a 'LOGIN' section with a text box explaining the login process and providing the email 'cryoport@enveo.at'. At the bottom, there is a login form with three input fields: 'Name:', 'Institution:', and 'E-mail:', and a button labeled 'Agree & Login'.

Fig. 2.2: Data disclaimer and login screen for accessing the public product database.

Internal database

The internal database for Glaciers_cci+ contains four additional tabs with input and output datasets for the two use cases on glacier dynamics in High Mountain Asia (HMA-in, HMA-out) and the Eastern Arctic (EA-in, EA-out). As for the public part, the tabs list all datasets in a table, providing some basic information, including an ID number, a description, the region and period covered, data category and format/type as well as a quicklook/coverage figure and download links for the dataset and associated metadata sheet. The ID number is a unique alphanumeric number used for internal identification of a dataset. The data category can be either: extent, elevation, velocity, surface elevation change (SEC) or 'other'. The metadata description provides information on the content of the file, product version, generation date, institute and author, satellite data used as input, geographical coverage, etc. It is provided as both a .docx and .pdf document. Additionally, there is a column which indicates whether a dataset is released and publicly available or not. Once a dataset is fit for release it will be moved to the public part of the database and this is indicated in this column. Figure 2.3 shows screenshots of the four main panels in the CRDP database listing the datasets. New datasets will be added during the project as they become available. An overview on the produced and/or foreseen datasets is provided in the following chapters. Figure 2.4 shows as example the standardized metadata sheet for "Surface elevation change in Svalbard from Sentinel-3B".

Figure 2.3: Screenshots of the four main panels of the CRDP database: a) HMA-in, b) HMA-out, c) EA-in, and d) EA-out. Note: not all datasets are visible; some datasets are placeholders for anticipated data sets.

Name	Surface elevation change in Svalbard from Sentinel-3B		
Description	Surface elevation change derived from Sentinel-3B SRAL data by CPOM		
Source	Initial data from Sentinel-3B SRAL Level 2 LAN product		
Reference	Initial data: Sentinel-3 Product Data Format Specification - SRAL/MWR Level 2 Land products, Reference: S3IPF.PDS.003.2, Issue 2.15, Date: 29/04/2020. Accessed from https://sentinel.esa.int/web/sentinel/user-guides/sentinel-3-altimetry/document-library in April 2021		
Temporal Coverage	December 2018 to December 2020	Temporal Resolution	n/a
Spatial Coverage	Svalbard	Spatial Resolution	1km
Vertical Coverage	n/a	Vertical Resolution	n/a
Map projection	EPSG 3413	File format	NetCDF

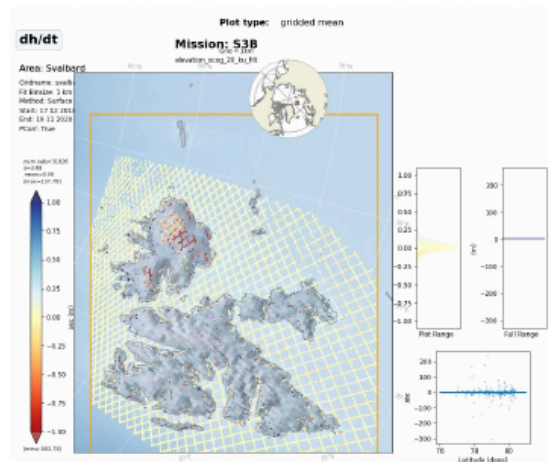

Figure 1: Surface elevation change from Sentinel-3B radar altimetry

Figure 2.4: Example metadata sheet for Surface elevation change in Svalbard derived from Sentinel-3B. This dataset is listed on the Eastern Arctic input tab (EA-out).

3. Datasets for the Eastern Arctic

The data production goals for the study region Eastern Arctic are:

- to provide an overview of glacier surges in Svalbard (characteristics, differences)
- to determine trends in flow velocities for the entire region
- to calculate glacier area changes for Franz-Josef- Land and Novaya Zemlya

For these purposes, we processed a diverse range of input data sets to generate the output datasets listed in Table 3.1. All datasets are or will be available from the internal server. Some of the output datasets will also be made publicly available once the related studies are published.

Two sets of data containing historical ice surface velocities over the Eastern Arctic (Novaya-Zemlya, Franz-Josef-Land, Severnaya Zemlya and Svalbard) are provided:

- 1) The velocities derived from offset-tracking of JERS-1 (1992-1998), ERS-1/2 (1991-2010) and ALOS-1 PALSAR-1 (2006-2011) data are available in vector format with metadata information for single image tracks. A comma-separated values (csv) file provides the northing and easting coordinates of measurement points, the elevation, the displacement in metres in the x, y and z directions, and the cross-correlation coefficient for each measurement. A metadata file in xml format provides information about the SAR images used, the processing parameters and quality aspects of the data such as the percent of valid information over ice and statistical measures over ice-free regions. In addition, for each image pair geotiff's of the three-dimensional ice surface displacement maps, the two intensity images, the differential interferogram, the phase coherence image, an RGB color composite of the coherence, intensity and intensity difference between both images, and the layover and shadow map are available.
- 2) Mosaics of ice velocities from various sensors and time intervals are available in Geotif format. This includes offset-tracking mosaics computed from the best winter JERS-1, ERS-1 and ALOS-1 PALSAR-1 image pairs, ERS-1/2 InSAR ice velocity maps of Nordaustlandet (Svalbard), South Svalbard and North-West Svalbard, and Sentinel-1 offset-tracking mosaics computed from winter 2020/2021 data.

Table 3.1: Products created for the test region eastern Arctic. FJL= Franz-Josef-Land, NZ= Novaya-Zemlya, SZ= Severnaya-Zemlya, all=FJL+NZ+SZ+Svalbard.

4. Datasets for High Mountain Asia

The data production goals for the study region High Mountain Asia are:

- to characterize the surges of three glaciers taking place in the central Karakoram
- to test the limits of current sensors for glacier area, elevation change and velocity products
- to analyse previous surges from historic datasets (Keyhole mission) for comparison

For these purposes, we processed a diverse range of input data sets to produce a set of products capturing the pre-surge and surge phase of the South and North Chongtar Glacier and an unnamed glacier, referred to as NN9, in the central Karakoram. The output products are listed in Table 4.1. The datasets consists of raster and shapefiles as well as image time series and cover the period 1972 to the present. All datasets are available from the internal server. Some of the output datasets will also be made publicly available once the related studies are published.

Table 4.1: Products created for the test region High Mountain Asia.
